AEGIS

Renewed Feature Strategy — Digital Threat Intelligence for Women's Safety

Goal: Avoid another SOS / GPS / generic AI safety app. Build a focused system that reconstructs how digital threats develop, connect, and escalate.

1. Feature shortlist

FEATURE	PURPOSE	NOVELTY	PRIORITY
Threat Escalation Engine	Turns messages/events into a chronological escalation pattern and explains what changed.	HIGH	P0
Digital Exposure Graph	Maps exposed identity, contact, location and profile signals and shows possible linkage.	HIGH	P0
Threat Linkage Engine	Finds explainable similarities between accounts, messages, profiles and incidents.	VERY HIGH	P0
Case Reconstruction	Connects evidence into a single incident narrative with supporting evidence.	HIGH	P0
Change Detection	Compares a new event with the previous case state and highlights newly appearing risk signals.	VERY HIGH	P0
Attack-Surface Simulator	Shows how user-provided/public information could combine into a larger exposure.	VERY HIGH	P1
Digital Safety Autopsy	Explains how the incident may have developed and identifies preventable exposure points.	HIGH	P1
Evidence Integrity Record	Hashes uploaded evidence and records timestamp, source and metadata without claiming legal admissibility.	MEDIUM	P1
Complaint Preparation Pack	Converts the reconstructed case into a factual, structured report for official channels.	MEDIUM	P1
Emergency / Official Help Hub	Provides verified emergency and cybercrime routes; no fake integrations.	LOW	P2

2. Pros / cons — decision view

FEATURE	PROS	CONS / RISKS	DECISION
Threat Escalation Engine	Strong demo moment; longitudinal reasoning; easy to explain.	Needs multiple events and careful language; heuristic scoring can be misread as prediction.	BUILD
Digital Exposure Graph	Cybersecurity depth; visually distinctive; actionable.	Requires reliable extraction and graph UX; avoid implying actual attacker knowledge.	BUILD
Threat Linkage Engine	Most distinctive; connects fragmented evidence; strong technical story.	False positives; image/username similarity needs cautious wording.	BUILD
Case Reconstruction	Turns raw evidence into an understandable story; useful for reporting.	Can become a generic summarizer if not evidence-linked.	BUILD
Change Detection	Very novel in demo; shows why a new event matters.	Needs persistent case state and comparison logic.	BUILD
Attack-Surface Simulator	Excellent cybersecurity angle; teaches prevention.	Can drift into speculative OSINT; use supplied/public evidence only.	IF TIME
Digital Safety Autopsy	Memorable post-incident learning feature.	May sound like blaming the victim if wording is poor.	CAREFULLY
Evidence Integrity Record	Simple, credible engineering detail; useful provenance.	Not inherently novel.	SUPPORT
Complaint Preparation Pack	Practical bridge to official reporting.	Common feature; not a differentiator.	SUPPORT
Emergency / Official Help Hub	Safety-critical utility; low implementation cost.	Extremely common; not novel.	SECONDARY

3. The five features that should define AEGIS

01 — Threat Escalation Engine

Question: Is this interaction getting worse?
Input: chronological messages/events. Output: stages such as unwanted contact → persistence → personal-information reference → intimidation → coercion, with evidence for each transition.

02 — Digital Exposure Graph

Question: What pieces of my digital identity may be connected?
Input: user-provided screenshots, profiles, usernames and identifiers. Output: an explainable graph of identity/contact/location/profile signals.

03 — Threat Linkage Engine

Question: Could these apparently separate accounts/events be related?
Signals: username patterns, repeated profile information, image similarity, wording and timing. Output must say *potential connection*, never definitive attribution.

04 — Case Reconstruction

Question: What actually happened?
Build a timeline linking each conclusion to supporting evidence. Produce a factual incident narrative rather than a generic AI summary.

05 — Change Detection

Question: What changed since the last event?
Compare the current case state with the previous one and surface newly detected signals, new accounts, new PII references and escalation changes.

4. Optional differentiator: Attack-Surface Simulator

Show how **user-provided or explicitly public information** can combine: username → profile → institution → location → contact identifier. Explain possible linkage and recommend privacy changes. Do not perform uncontrolled OSINT crawling or claim to know what an attacker actually knows.

5. What NOT to spend hackathon time on

• Generic SOS / shake-to-alert as a headline feature

• Live GPS tracking or generic safe-route maps

• A supportive AI chatbot

• Generic safety tips dashboard

• Fake police / cybercrime API integrations

• Automatic accusation of an account or person

• Nationwide crime heatmaps

• Large-scale OSINT crawling

• A simple risk score with no evidence or explanation

6. Recommended hackathon MVP

Core flow: Upload/paste evidence → detect signals → build escalation timeline → map digital exposure → link potentially related evidence → reconstruct case → show what changed → generate factual next steps.

Winning demo moment: A second piece of evidence arrives and AEGIS does not merely re-score the incident. It shows **what changed**, **which previous evidence it connects to**, and **why the case has escalated**.

Positioning: “AEGIS is a personal digital threat intelligence system that reconstructs how online abuse develops, connects fragmented evidence, and shows women what changed, what may be exposed, and what

they can do next.”
